软件开发中,bug就像家常便饭一样。有了bug就需要修复,在Git中,由于分支是如此的强大,所以,每个bug都可以通过一个新的临时分支来修复,修复后,合并分支,然后将临时分支删除。

当你接到一个修复一个代号101的bug的任务时,很自然地,你想创建一个分支issue-101来修复它,但是,等等,当前正在dev上进行的工作还没有提交:

```
$ git status
# On branch dev
# Changes to be committed:
# (use "git reset HEAD <file>..." to unstage)
#
# new file: hello.py
#
# Changes not staged for commit:
# (use "git add <file>..." to update what will be committed)
# (use "git checkout -- <file>..." to discard changes in working directory)
#
# modified: readme.txt
#
```

并不是你不想提交,而是工作只进行到一半,还没法提交,预计完成还需1天时间。但是,必须在两个小时内修复该bug,怎么办?

幸好, Git还提供了一个stash功能, 可以把当前工作现场"储藏"起来, 等以后恢复现场后继续工作:

```
$ git stash
Saved working directory and index state WIP on dev: 6224937 add merge
HEAD is now at 6224937 add merge
```

现在,用git status查看工作区,就是干净的(除非有没有被Git管理的文件),因此可以放心地创建分支来修复bug。

首先确定要在哪个分支上修复bug,假定需要在master分支上修复,就从master创建临时分支:

```
$ git checkout master

Switched to branch 'master'

Your branch is ahead of 'origin/master' by 6 commits.

$ git checkout -b issue-101

Switched to a new branch 'issue-101'
```

现在修复bug, 需要把 "Git is free software ..." 改为 "Git is a free software ...", 然后提交:

```
$ git add readme.txt
$ git commit -m "fix bug 101"
[issue-101 cc17032] fix bug 101
1 file changed, 1 insertion(+), 1 deletion(-)
```

修复完成后,切换到master分支,并完成合并,最后删除lissue-101分支:

```
$ git checkout master
Switched to branch 'master'
Your branch is ahead of 'origin/master' by 2 commits.
$ git merge --no-ff -m "merged bug fix 101" issue-101
Merge made by the 'recursive' strategy.
readme.txt | 2 +-
1 file changed, 1 insertion(+), 1 deletion(-)
$ git branch -d issue-101
Deleted branch issue-101 (was cc17032).
```

太棒了,原计划两个小时的bug修复只花了5分钟!现在,是时候接着回到dev分支干活了!

```
$ git checkout dev
Switched to branch 'dev'
$ git status
```

```
# On branch dev
nothing to commit (working directory clean)
```

工作区是干净的,刚才的工作现场存到哪去了?用git stash list命令看看:

```
$ git stash list
stash@{0}: WIP on dev: 6224937 add merge
```

工作现场还在, Git把stash内容存在某个地方了, 但是需要恢复一下, 有两个办法:

一是用git stash apply恢复,但是恢复后,stash内容并不删除,你需要用git stash drop来删除;

另一种方式是用git stash pop,恢复的同时把stash内容也删了:

```
$ git stash pop
# On branch dev
# Changes to be committed:
# (use "git reset HEAD <file>..." to unstage)
#
# new file: hello.py
#
# Changes not staged for commit:
# (use "git add <file>..." to update what will be committed)
# (use "git checkout — <file>..." to discard changes in working directory)
#
# modified: readme.txt
#
Dropped refs/stash@{0} (f624f8e5f082f2df2bed8a4e09c12fd2943bdd40)
```

再用git stash list查看,就看不到任何stash内容了:

```
$ git stash list
```

你可以多次stash,恢复的时候,先用git stash list查看,然后恢复指定的stash,用命令:

\$ git stash apply stash@{0}

小结

修复bug时,我们会通过创建新的bug分支进行修复,然后合并,最后删除;

当手头工作没有完成时,先把工作现场git stash一下,然后去修复bug,修复后,再git stash pop,回到工作现场。
